

In the claims:

1. (Currently Amended) A method of processing calls in a call processing center of an organization that processes calls in support of enterprise activities of the organization, such method comprising the steps of:

the call center receiving a first call and assigning the first call to a live agent;

receiving a query about the enterprise activities of the organization from a caller during a second call through the call center of the organization;

translating the query into voice extensible mark-up language;

forming an answer to the translated query within an artificial intelligence engine of the call center wherein the artificial intelligence engine knowledge universe is substantially limited to the enterprise activities of the organization; and

the call center providing the determined answer to the caller.

2. (Currently Amended) The method of processing calls in the call processing center as in claim 1 ~~further comprising receiving the query through a switched circuit connection~~ wherein the artificial intelligence engine utilizes a caller call record including identity and contact history to form a context for processing the call.

3. (Currently Amended) The method of processing calls in the call processing center as in claim 2 wherein the step of receiving the query through the switched circuit connection further comprises recognizing spoken words of

~~the caller~~ forming an answer further comprises forming the answer in the form of VXML code within the AI engine.

4. (Currently Amended) The method of processing calls in the call processing center as in claim ~~±~~ 3 wherein the step of providing the determined answer to the caller further comprises converting the provided answer into ~~extensible mark-up language~~ audible speech.

5. (Currently Amended) The method of processing calls in the call processing center as in claim 4 wherein the ~~step of translating the provided answer into extensible mark-up language further comprises generating audible speech~~ artificial intelligence engine utilizes the expertise and inputs normally associated with a live agent.

6. (Original) The method of processing calls in the call processing center as in claim 1 wherein the step of receiving the query further comprises detecting the query within an html document.

7. (Original) The method of processing calls in the call processing center as in claim 1 wherein the step of receiving the query further comprises detecting the query within an e-mail.

8. (Currently Amended) An apparatus for processing calls in a call processing center of an organization that processes calls in support of enterprise activities of the organization, such apparatus comprising:

means within the call center for receiving a first call and assigning the first call to a live agent;

means for receiving a query about the enterprise activities of the organization from a caller during a second call through the call center of the organization;

means for translating the query into voice extensible mark-up language;

means for forming an answer to the translated query within an artificial intelligence engine of the call center wherein the artificial intelligence engine uses a knowledge universe which is substantially limited to the enterprise activities of the organization; and

means within the call center for providing the determined answer to the caller.

9. (Currently Amended) The apparatus for processing calls in the call processing center as in claim 8 ~~further comprising means for receiving the query through a switched circuit connection~~ wherein the artificial intelligence engine utilizes a callers call record including identity and contact history to form a contact for processing the call.

10. (Currently Amended) The apparatus for processing calls in the call processing center as in claim 9 ~~wherein the means for receiving the query through the switched circuit connection~~ forming an answer further comprises means for forming the answer in the form of VXML code within the AI engine ~~recognizing spoken words of the caller.~~

11. (Currently Amended) The apparatus for processing calls in the call processing center as in claim 8 ~~10~~ wherein the means for providing the determined answer to the caller further comprises means for converting the

provided answer into ~~extensible mark up language~~audible speech.

12. (Currently Amended) The apparatus for processing calls in the call processing center as in claim 11 wherein the ~~means for translating the provided answer into extensible mark up language further comprises means for generating audible speech~~ artificial intelligence engine utilizes the expertise and inputs normally associated with a live agent.

13. (Original) The apparatus for processing calls in the call processing center as in claim 8 wherein the means for receiving the query further comprises means for detecting the query within an html document.

14. (Original) The apparatus for processing calls in the call processing center as in claim 8 wherein the means for receiving the query further comprises means for detecting the query within an e-mail.

15. (Currently Amended) An apparatus for processing calls in a call processing center of an organization that processes calls in support of enterprise activities of the organization, such apparatus comprising:

an agent station of the call center that receives a first call and where the first call is handled by a live agent;

a voice extensible mark-up language interpreter of the call center adapted to translate a query about the enterprise activities of the organization from a caller

during a second call into voice extensible mark-up language;

an artificial intelligence engine of the call center adapted to form an answer to the translated query within an artificial intelligence engine wherein the artificial intelligence engine uses a knowledge universe which is substantially limited to the enterprise activities of the organization; and

a speech synthesizer of the call center adapted to provide the determined answer to the caller.

16. (Currently Amended) The apparatus for processing calls in the call processing center as in claim 15 ~~further comprising a switched circuit connection adapted to receive the query~~ wherein the artificial intelligence engine utilizes a caller call record including identity and contact history to form a context for processing the call.

17. (Currently Amended) The apparatus for processing calls in the call processing center as in claim ~~15~~ 14 wherein the ~~means for receiving the query further comprises means for detecting the query within an html document~~ artificial intelligence engine forms the answer in VXML code.

18. (Original) The apparatus for processing calls in the call processing center as in claim 15 further comprising a speech recognition application adapted to recognize spoken words of the caller.

19. (Original) The apparatus for processing calls in the call processing center as in claim 15 wherein the means for

receiving the query further comprises a web site adapted to detect the query within an e-mail.

20. (Currently Amended) A method of processing calls in a call processing center of an organization, such method comprising the steps of:

an agent terminal adapted to allow a first call to be handled by a live agent;

the call center of the organization receiving a text-based question from a caller during a second call;

converting the text-based question into a metaprogramming language understood by an artificial intelligence engine of the call center;

determining an answer to the text-based question within the artificial intelligence engine wherein the artificial intelligence engine encodes the answer in VXML code;

the call center providing the determined answer to the caller in the form of audible speech.

21. (Cancelled)
